

CLOUD COMPUTING FUNDAMENTALS

Jayanthi R
192524295

Hardware evolution
Mainframes to commodity
enables

Virtualization
Multiple VMs per
server

Internet & software
web protocols,
browsers
enables

web application
remote access to
apps

service delivery
cloud as a utility model

IaaS, PaaS, SaaS, XaaS

Distributed systems
clustering, grid
computing
informs

Resource sharing
load balancing,
fault, Tolerance

Evolution of cloud computing

cloud service Models

SaaS (software as a service)	Provider manages • Applications • Runtime • Middleware • OS • Infrastructure Eg:- google workspace, Microsoft 365	User manages • Data • User settings
PaaS (platform as a services)	Provider manages • Infrastructure • Network • storage • servers • OS • Runtime Eg:- Google App engine, Heroku	User manages • Application • Data
IaaS (Infrastructure as a service)	Provider manages • Physical servers • storage • Networking • Virtualization	User manages • OS • Middle ware • Run Time • Application • Data

cloud service Models

Scalability Scale resource up or down based on demand	Flexibility Adapt quickly to changing business needs	Cost Efficiency Pay for what you use and reduce capital expenditure	on-Demand Access Access services anytime, anywhere over internet.
