

Experiment No. 1: Flight Reservation System

Aim:

To create a simple cloud software application for a Flight Reservation System using a Cloud Service Provider to demonstrate SaaS, including fields such as One Way, Round Trip, From, To, Departure Date, Travelers & Class, Fare Type, and International/Domestic Flights.

Procedure:

1. Login to the Cloud Service Provider platform using valid credentials.
2. Create a new application and name it “Flight Reservation System”.
3. Design a form with fields such as Passenger Name, Arrival Airport, Seat Preference, Payment Status, Booking Date, Reservation Number and Contact Email.
4. Configure field types (text, dropdown, date-time, email) and set validation rules for mandatory fields.
5. Add a trip type option to support One Way and Round Trip selection along with Travellers & Class and Fare Type fields.
6. Publish the application to make it accessible as a SaaS module.
7. Enter sample passenger and flight details into the application to test the workflow.
8. Generate the report view to verify that the submitted data is stored and displayed correctly.

Algorithm / Output Screenshot:

The top screenshot displays the 'passenger details' form in the flight reservation system. The form includes fields for passenger name (First Name and Last Name), Email, Address (Address Line 1 and Address Line 2), City / District, State / Province, Postal Code, Country, Phone (with a dropdown for country code), Date (dd-MMM-yyyy), Time (HH:mm:ss), and Number (#####).

The bottom screenshot displays the 'passenger details Report' table. The table has columns for passenger name, email, address, phone, date, time, and number. The data shown is for a passenger named JASMITHA R, with email jas.sts@saveetha.com, address no.716 mgr str chennai, chennai, tamilnadu, India, phone +91884923690, date 25-Jul-2026, time 22:48:05, and number 8.

passenger Name	Email	Address	Phone	Date	Time	Number
JASMITHA R	jas.sts@saveetha.com	no.716 mgr str chennai, chennai, tamilnadu, India	+91884923690	25-Jul-2026	22:48:05	8

Result:

A cloud-based Flight Reservation System application was successfully designed and deployed using a Cloud Service Provider, and the SaaS model was demonstrated by capturing and displaying passenger and reservation details as shown in the output.

Experiment No. 2: Online Food Ordering System

AIM:

To create an Online Food Ordering System using Zoho Creator that allows customers to view food items, enter their details, select items, place orders, and track the order status. Zoho Creator forms store submitted data and can be connected with reports and workflows.

PROCEDURE:

1. Open Zoho Creator and create a new application.
2. Create a Food Menu form with fields:
 - Food Name
 - Category
 - Price
 - Quantity Available
 - Description
3. Create an Order Form with:
 - Customer Name
 - Mobile Number
 - Food Item
 - Quantity
 - Delivery Address
 - Payment Method
 - Order Status
4. Add sample food items such as Pizza, Burger, Fried Rice, Pasta and Sandwich.
5. Create a report to display the available food items and customer orders.
6. Set the default Order Status as Pending.

7. Create a workflow on order submission to update the order and display an order-confirmation message. Zoho Creator supports workflows triggered by form submission and other record events.
8. Test the application by entering customer details, selecting food, specifying quantity and submitting the order.
9. Verify the submitted order in the Orders report

Algorithm / Output Screenshot:

The screenshot displays the Zoho Creator interface for an 'ONLINE FOOD ORDERING' application. The top navigation bar includes a menu icon, the application name 'ONLINE FOOD ORDERING', a plus icon, and tabs for 'Design', 'Workflow', and 'Settings'. On the right side of the top bar are buttons for 'Upgrade', a notification bell, and 'Access this application'. The left sidebar contains a menu with 'ONLINE FOOD ORDERING' (with a sub-link 'FOOD MENU'), 'CUSTOMER DETAILS', 'Restaurant Details', and 'FOOD MENU' (which is currently selected). The main workspace shows the 'FOOD MENU' form with the following fields: 'FOOD ID' (with a numeric mask), 'FOOD NAME', 'FOOD PRICE' (with a currency mask), 'DESCRIPTION', and 'AVAILABILITY' (a dropdown menu set to 'STARTERS'). A 'Submit' button is located at the bottom of the form. On the right, the 'Form Customization - Web' panel is open, showing 'Label placement' options with four different layout templates. The bottom left corner shows the user profile 'JASMITHA R' with a profile icon and notification bell.

Result:

Thus, an Online Food Ordering System was successfully created using Zoho Creator. Customers can select food items, place orders, and view order details, while the application stores and manages the order information efficiently

Experiment No. 3: Taxi Booking System

AIM

To develop a Taxi Booking System that allows users to book taxis, enter pickup and destination details, select a taxi, and manage booking information efficiently.

PROCEDURE

1. Create the Taxi Booking System application and design the user interface.
2. Create fields for Customer Name, Mobile Number, Pickup Location, Destination, Date, and Time.
3. Add taxi details such as Taxi ID, Driver Name, Vehicle Number, and Availability.
4. Allow the customer to enter pickup and destination locations.
5. Check the availability of taxis and assign an available taxi to the customer.
6. Calculate and display the estimated fare and confirm the booking.
7. Store the booking details and provide the customer with the booking ID and taxi details

Algorithm / Output Screenshot:

The screenshot displays a web application interface for a taxi booking system. The top navigation bar includes the application name 'taxi booking', a trial expiration notice 'Trial expires in 12 days', and links for 'Upgrade', 'Edit this application', and 'Help'. The left sidebar contains a menu with 'passenger details' and 'passenger details Report'. The main content area is divided into two sections: 'passenger details' and 'passenger details Report'.

passenger details

Name: (First Name) (Last Name)

Phone: (+91 81234 56789)

Address: (Address Line 1) (Address Line 2)

City / District: State / Province: (Country)

Pickup Location:

Drop Location:

Booking Date: (dd-MMM-yyyy)

Pickup Time: (HH:mm:ss)

passenger details Report

Showing 1 of 1

Result:

A cloud-based Taxi Booking Reservation System was successfully developed and deployed, demonstrating SaaS by capturing cab booking details as shown in the output.

Experiment No. 4: Library Book Reservation System

AIM

To develop a Library Book Reservation System for SIMATS Library that allows users to search, reserve, and manage library books efficiently.

PROCEDURE

1. Create the Library Book Reservation application and design the user interface.
2. Create fields for Title, Author, Publication, Year, Edition, No. of Copies, Rack No., and Status.
3. Add book details and maintain the availability status as Taken/Returned.
4. Allow users to search for books using the Title or Author.
5. Display the available books and their corresponding rack numbers.
6. Allow users to reserve an available book and update its status.
7. Store the reservation details and provide confirmation to the user.

Algorithm / Output Screenshot:

This screenshot shows the top half of the 'Library Book Reservation' form. The left sidebar contains the application logo and navigation links: 'Library Book Reservation' (selected), 'Library Book Reservation Report', and 'Library Book Reservation'. The main form area includes the following fields:

- Student Name ***: Two input fields for 'First Name' and 'Last Name'.
- Register Number ***: A single-line text input field.
- Department ***: A dropdown menu with '-Select-' as the current selection.
- Title of the Book ***: A single-line text input field.
- Author ***: Two input fields for 'First Name' and 'Last Name'.
- Publication**: A single-line text input field.
- Year ***: A single-line text input field.
- Edition**: A single-line text input field.
- Number of Copies ***: A single-line text input field.
- Rack Number**: A single-line text input field.
- Book Status ***: A dropdown menu with '-Select-' as the current selection.
- Issue Date ***: A date input field with the placeholder 'dd-MMM-yyyy'.

This screenshot shows the bottom half of the 'Library Book Reservation' form. The left sidebar is identical to the first screenshot. The main form area includes the following fields:

- Publication**: A single-line text input field.
- Year ***: A single-line text input field.
- Edition**: A single-line text input field.
- Number of Copies ***: A single-line text input field.
- Rack Number**: A single-line text input field.
- Book Status ***: A dropdown menu with '-Select-' as the current selection.
- Issue Date ***: A date input field with the placeholder 'dd-MMM-yyyy'.
- Return Date ***: A date input field with the placeholder 'dd-MMM-yyyy'.
- Librarian Name ***: Two input fields for 'First Name' and 'Last Name'.
- Remarks**: A multi-line text input field.

At the bottom of the form, there is a blue button labeled 'Submit'.

RESULT:

Thus, the Library Book Reservation System for SIMATS Library was successfully developed to manage book details, check availability, and reserve books efficiently.

Experiment No. 5: Mark Sheet Processing System

AIM

To develop a Mark Sheet Processing System that calculates students' marks, total, average, grade, and pass/fail status efficiently.

PROCEDURE

1. Create the Mark Sheet Processing application and design the user interface.
2. Create fields for Student Name, Register Number, Subject Names, and Marks.
3. Enter and store the marks obtained by each student in all subjects.
4. Calculate the Total Marks obtained by the student.
5. Calculate the Average/Percentage based on the marks.
6. Determine the Grade and Pass/Fail Status according to the marks obtained.
7. Display and store the complete Mark Sheet for the student.

Algorithm / Output Screenshot:

The screenshot shows the 'Student Mark Sheet' form in the 'Mark Sheet Processing System'. The form includes fields for Student Name (First Name and Last Name), Register Number, Department, Semester, and five subjects (Subject 1 to Subject 5). Each subject field has a placeholder '#####'. There is also an 'Overall Performance' field. A 'Submit' button is at the bottom.

Mark Sheet Processing System

Student Mark Sheet

Student Name: First Name, Last Name

Submit

The screenshot shows the 'Student Mark Sheet Report' in the 'Mark Sheet Processing System'. It displays a table with student information and marks. The table has columns for Student Name, Register Number, Department, Semester, Subject 1, Subject 2, Subject 3, Subject 4, Subject 5, Total Marks, Average, and Overall Performance. The data for Sara Khan is shown.

Mark Sheet Processing System

Student Mark Sheet Report

Student Name: Sara Khan

Register Number: 852741

Department: AI&DS

Semester: 2

Subject 1: 95

Subject 2: 88

Subject 3: 90

Subject 4: 85

Subject 5: 92

Total Marks: 450

Average: 90.00

Overall Performance:

Add a comment

RESULT

Thus, the Mark Sheet Processing System was successfully developed to calculate and display students' total marks, average, grade, and pass/fail status accurately.

Experiment No. 6: Payroll Processing System

Aim:

To create a simple cloud software application for a Payroll Processing System using a Cloud Service Provider to demonstrate SaaS, including fields such as Name of Employee, Experience, Basic Pay, HRA, DA, TA, Net Pay and Gross Pay.

Procedure:

1. Login to the Cloud Service Provider platform and create a new application named “Payroll Processing System”.
2. Design the form with fields such as Name, Email and Phone of the employee.
3. Add a Payment Status field to indicate whether the salary has been Processed or Pending.
4. Include Allowance Type and Deduction Type fields to record HRA, DA, TA and other components.
5. Add a Payment Method field with options such as Cash, Bank Transfer, etc.
6. Set validation rules for mandatory fields such as Name, Email and Phone.
7. Publish the application and enter a sample employee payroll record to test it.
8. Generate the report to verify the payroll details are computed and displayed correctly.

Algorithm / Output Screenshot:

The top screenshot displays the 'Pay Roll form' interface. It includes a sidebar with 'Pay Roll form' and 'Pay Roll form Report' options. The main form contains the following fields:

- Employee ID * (masked with 7 asterisks)
- Employee Name * (split into First Name and Last Name)
- Basic pay (masked with 7 asterisks)
- DA (masked with 7 asterisks)
- HRA (masked with 7 asterisks)
- CCA (masked with 7 asterisks)
- PF (masked with 7 asterisks)
- Income Tax (masked with 7 asterisks)
- LOP (masked with 7 asterisks)
- Gross Salary (masked with 7 asterisks)
- Net Salary (masked with 7 asterisks)

The bottom screenshot displays the 'Pay Roll form Report' interface. It features a table with columns for Employee ID and Employee Name. The data shown is:

Employee ID	Employee Name
124	tara kumar
123	sara ali

Below the table, a detailed breakdown for Employee ID 124 is shown:

Field	Value
Employee ID	124
Employee Name	tara kumar
DA	10
HRA	15
CCA	2500
PF	5
Income Tax	8
LOP	0
Gross Salary	65000
Net Salary	58500
Basic pay	50000

Result:

A cloud application for the Payroll Processing System was successfully created and deployed, demonstrating SaaS by processing and displaying employee salary details as shown in the output.

Experiment No. 7: Students Attendance System

Aim:

To create a simple cloud software application for a Students Attendance System using a Cloud Service Provider to demonstrate SaaS, including fields such as Name of Student, Course, Present, Absent, Course Attendance, OD Request, Grade and Attendance Percentage.

Procedure:

1. Login to the Cloud Service Provider platform and create a new application named “Students Attendance System”.
2. Design the form with fields such as Name, Email and Attendance Date.
3. Add a Status field with options such as Present or Absent to mark daily attendance.
4. Include Check In Time and Check Out Time fields to record student presence duration.
5. Add an Updated At field to automatically capture the last modification timestamp.
6. Set validation rules to make Name, Email and Attendance Date mandatory.
7. Publish the application and enter a sample attendance record to test the workflow.
8. View the generated report to verify the attendance data is stored and displayed correctly.

Algorithm / Output Screenshot:

The image displays two screenshots of a web application titled "Student Attendance System". The interface features a dark blue sidebar on the left with the following menu items: "Student Attendance System", "Student Attendance", "Student Attendance Report", and "Student Attendance". The main content area is titled "Student Attendance".

Top Screenshot: This view shows the "Student Attendance" form with the following fields and options:

- Student ID * (Text input with placeholder "#####")
- Student Name * (Two text inputs for First Name and Last Name)
- Course * (Dropdown menu with "-Select-" selected)
- Date (Text input with placeholder "dd-MMM-yyyy")
- Attendance Status * (Radio buttons for Present and Absent)
- Course Attendance * (Text input with placeholder "#####")
- Total Classes * (Text input with placeholder "#####")
- Attendance Percentage (Text input with placeholder "#####.##")
- OD Request * (Radio buttons for yes and no)
- OD Reason (Text input)

Bottom Screenshot: This view shows the same "Student Attendance" form with additional fields:

- Course Attendance * (Text input with placeholder "#####")
- Total Classes * (Text input with placeholder "#####")
- Attendance Percentage (Text input with placeholder "#####.##")
- OD Request * (Radio buttons for yes and no)
- OD Reason (Text input)
- Grade * (Dropdown menu with "-Select-" selected)
- Faculty Name * (Two text inputs for First Name and Last Name)
- Remarks (Text input)

Result:

A cloud-based Students Attendance System was successfully developed and deployed, demonstrating SaaS by recording and displaying student attendance details as shown in the output.

Experiment No. 8: Student Counselling System

Aim:

To create a simple cloud web application for a Student Counselling System using a Cloud Service Provider to demonstrate SaaS, including fields such as Student Name, Age, Address, Phone, Subjects Studied, Year of Passing, Percentage of Marks and Domain Interest.

Procedure:

1. Login to the Cloud Service Provider platform and create a new application for the Student Counselling System.
2. Design the form with fields such as Name, Email and Phone of the student.
3. Add Region and Availability Zone fields to record the counselling centre/location details.
4. Include Onboarding Time and Response Time fields to track the counselling session schedule.
5. Configure field validations to make Name, Email and Phone mandatory.
6. Add dropdown options where applicable to standardise data entry.
7. Publish the application and enter a sample student counselling record to test it.
8. Generate the report to verify that the counselling details are captured and displayed correctly.

Experiment No. 9: Hospital Information System (SIMATS Hospital)

Aim:

To create a simple cloud software application for a Hospital Information System for SIMATS Hospital using a Cloud Service Provider to demonstrate SaaS, including fields such as Patient Name, Age, Address, Phone, Email, Attender Name, Attender Phone, Doctor Name and Diseases.

Procedure:

1. Login to the Cloud Service Provider platform and create a new application named “Hospital Information System”.
2. Design the form with fields such as Name, Email, Phone and Address of the patient.
3. Add a Diseases field to record the medical condition of the patient.
4. Include Attender Name and Doctor Name fields to capture attendant and consulting doctor details.
5. Configure the Address field to auto-capture location details for the patient.
6. Set validation rules to make Name, Phone and Diseases mandatory fields.
7. Publish the application and enter a sample patient record to test the workflow.
8. View the generated report to verify the patient and hospital details are displayed correctly.

Experiment No. 10: Student Information Display System (C Program Template)

Aim:

To create a simple cloud software application to run a C program to display student information using a Cloud Service Provider to demonstrate SaaS, with the template of Student Name, Register Number, Address, Phone, Age, Courses, Grades, Attendance Report, Progress Report and Semester Mark Sheet forms.

Procedure:

1. Login to the Cloud Service Provider platform and create a new application named “Cloud Service Provider 1” for student information.
2. Design the form with fields such as Name, Register Number and Address of the student.
3. Add Phone and Age fields to capture the personal details of the student.
4. Include Courses and Grade fields to record academic enrolment and performance.
5. Configure field types such as numeric for Age and dropdown for Grade.
6. Set validation rules to make Name, Register Number and Phone mandatory.
7. Publish the application and enter a sample student record to test the C program based template.
8. Generate the report to verify the student information is stored and displayed correctly.

Algorithm / Output Screenshot:

The screenshot displays two views of a web application titled "Student Information System".

Top View: Student Information Form

The form is titled "Student Information" and contains the following fields:

- Student Name * (First Name, Last Name)
- Register Number * (#####)
- Address *
- Phone Number * (+91 81234 56789)

Result:

A cloud application to display student information based on a C program template was successfully created and deployed, demonstrating SaaS by capturing student academic and personal details as shown in the output.

Experiment No. 11: Online Super Market

Aim:

To create a simple cloud software application for an Online Super Market using a Cloud Service Provider to demonstrate SaaS, with the template of Customer Name, Address, Phone, Email, Items, Quantity and item classification form.

Procedure:

1. Login to the Cloud Service Provider platform and create a new application named “Cloud Service Provider 2” for the Online Super Market.
2. Design the form with fields such as Customer Name, Customer Address and Customer Phone.
3. Add Customer Email and Order Date fields to capture order details.
4. Include a Total Amount field to compute the value of items purchased.
5. Configure an item classification form to categorise products such as groceries, electronics, etc.
6. Set validation rules to make Customer Name, Phone and Email mandatory fields.
7. Publish the application and enter a sample customer order to test the workflow.
8. View the Customer Order Report to verify the order details are displayed correctly.

Algorithm / Output Screenshot:

The screenshot shows the 'Customer Order' form in the Online Super Market application. The form is located on the right side of the dashboard, with a sidebar on the left containing navigation links: 'Customer Order', 'Customer Order Report', and 'Item Classification'. The form fields are as follows:

- Customer Name:
- Address:
- Phone Number:
- Email:
- Item Category:
- Item Name:
- Quantity:
- Price:
- Total Amount:
- Payment Method:

A 'Submit' button is located at the bottom of the form.

The screenshot shows the 'Customer Order Report' in the Online Super Market application. The report is displayed in a table format with columns for Customer Name, Address, and Phone Number. The table contains one entry for a customer named Oviya. The details of the order are shown in a modal window on the right side of the report.

Customer Name	Address	Phone Number
Oviya	ABC flats, Vadapalani, Chennai-99	+917894561230

The modal window displays the following details:

Customer Name	Oviya
Address	ABC flats, Vadapalani, Chennai-99
Phone Number	+917894561230
Email	oviya@gmail.com
Item Category	Dairy Products
Item Name	curd
Quantity	1
Price	\$ 30.00
Payment Method	Cash
Total Amount	30.00

An 'Add a comment' link is located at the bottom of the modal window.

Result:

A cloud application for the Online Super Market was successfully created and deployed, demonstrating SaaS by capturing and displaying customer order details as shown in the output.
